                      PT New nucleic acid encoding testis-specific cytokine receptor - useful PT New nucleic acid encoding testis-specific cytokine receptor - useful PT male contraceptives or for infertility treatment Claim 2; Page 47-48; 79pp; English.

CC This sequence represents a novel ligand-binding receptor, Zcytor2, CC which shares homology with cytokine receptors and was isolated from human CC placental polya+ RNA. The resulting polyapeptide is a receptor for CC cytokines (particularly interleukin-13) and is expressed on the surface CC cytokines (particularly interleukin-13) and is expressed on the surface CC cytokines (particularly interleukin-13) and is expressed on the surface CC differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise CC ligand-receptor interactions and as male-specific contraceptives. By CC ligand-receptor can also be used to modulate immune function, e.g. in CC alienty the action of II-13, receptor antagonists and ligand-binding CC this receptor can also be used to modulate immune function, e.g. in CC contraceptives. By contraceptive can be used to disease such as cancer), for labelling cells that express the receptor, and the receptor, as antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human zcytor2 cytokine receptor protein.

This protein comprises a novel human cytokine/peptide hormone receptors/designated HR-1 receptor. The amino acid sequence was deduced from a cDNA clone (see v04075) isolated from a human testis cDNA library. It shows 27% amino acid identity and 52% similarity with the human interleukin-5 receptor. Also claimed are polynucleotides encoding HR-1 receptor, vector and host cells, an agonist to the polypeptide, antibody against the polypeptide, an antagonist that inhibits the activity of the polypeptide, a process for diagnosing a disease, or a susceptibility to disease, related to expression of HR-1 receptor, and a method for identifying compounds that activate or inhibit the HR-1 receptor. HR-1
                                                                                                                                                                                                                                                                                                                                    N-PSDB; v04075.
Human cytokine/peptide hormone receptor, HR-1 receptor - useful to
increase resistance to infections in individuals with trauma and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human cytokine/peptide receptor, HR-1 receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (HR-1 receptor). This, or it's activators or agonists, can be used to treat, prevent or diagnose predisposition to lowered resistance to infection; asthma, allergic or haematopoietic disorders, e.g. where indured by acquired immune deficiency syndrome (AIDS), aplastic anaemia, neutrop, ania or cytotoxic treatments for cancer. Antagonists of the receptor, e.g. antibodies or fragments of it may be used to treat conditions associated with overexpression of the HR-1 receptor, e.g. hose listed above. Antibodies may also be used to assay levels of HR-1 receptor; overexpression of which may be diagnostic of tumours, by usual lumminoassays; to isolate and identify HR-1 receptor expressing cells; or finity purification of the HR-1 receptor.
invention relates to new purified peptides comprising 380 or 427 amino acid sequences, which are receptors for interleukin-13 (IL-13); the 380 and 427 aa proteins are designated IL-13R beta and alpha respectively. The IL-13R beta has high affinity for IL-13 while IL-13R alpha has low affinity, but acquirs high affirity when associated with the IL-4
                                                   This sequence represents interleukin-13 (IL-13) beta receptor. The invention relates to new purified peptides comprising 380 or 427 ami acid sequences, which are receptors for interleukin-13 (IL-13); the
                                                                                                                                     acids,
                                                                                                                                                                                                                                                                                    Homo sapiens.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of II-13 receptors; when coupled to a toxin also for treatment of overproduction of II-13R. Cells that express II-13R at the surface are used to identify ligands and modulators of II-13R. Note: II-13R beta is encoded by the nucleic acid sequence shown in Figure 2a in the specification (786464), which is not the same as that shown in the sequence 11sting (R5828).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       such as loss of heterozygosity and rearrangements, or chromosomal anomalies. They are also used for production of recombinant II-13R beta and alpha which can be used as II-13 antagonists, specifically to an delibration and alpha which can be used as II-13 antagonists, specifically to regulate II-13-induced responses for treatment of inflammation and allergy. II-13 receptors are also useful as antisense molecules for gene therapy (blocking synthesis of II-13R). Antibodies are used (in standard immunoassays) to diagnose diseases associated with abnormal expression of II-13R).
                                                                                                                                                                                                                                       W09747741-A1.
                                                                                                                                                                                                                                                                                                              Protein
                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          resistance to infection, asthma, allergy or haematopoletic disease Claim 13; Page 62-64; 76pp; English.

This protein comprises a novel human cytokine/peptide hormone receptor, designated the HR-1 receptor, that shows 27% identity and 52% similarity to the interleukin-5 receptor. Its amino acid sequence was deduced from a CDNA clone (see VQ4131) obtained from a channel from the sepressed in claimed host cells, and used in a claimed method for identifying compounds which bind to, and activate or inhibit, it. HR-1 receptor activators and agonists can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoletic disorders, e.g. where induced by AIDS, aplastic mamemia, neutropaenia or cytotoxic treatments for cancer. HR-1 antagonists, e.g. antibodies or HR-1 receptor fragments, can be used to treat conditions associated with HR-1 receptor levels, since overexpression may be diagnostic of tumours.

PT New nucleac acid encoding testis-specific cytokine receptor - useful PT for identification of ligands or antagonists, potentially for use as property for intertility treatment contraceptives or for intertility treatment contraceptor. Zeytor2, which contraces because represents a novel ligand-binding receptor. Zeytor2, which contraces because contraction convertible in contractions and was isolated from a human contraction contraction contraction. The resulting polypeptide is a receptor for cytokines (particularly intersleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can contract to differentiation of such cells in cultures and may also be used to treat contracterise contractions and as male-specific contraceptives. By blocking the action of II-13, receptor antagonists and ligand-binding contraction; e.g. in contraction can also be used to modulate immune function, e.g. in contraction and as males of determine circulating levels of contraction and as antagonist. The determine circulating levels of contraction and contraction and and also to isolate and purify ligands. Antibodies can be used to cand they are contracted to a santagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which shares homology with cytokine receptors and is isolated from testis tissue obtained from a Celebus macaque. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands promoting proliferation of such cells in cultures and may also be used to creat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of II-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that

Example 14; Page 52-53; 69pp; English.

The IL-13 binding protein and related therapeutic molecules can be in the antagonism of at least one IL-13 activity. They can be used treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after treatment. The products can also be used as diagnostic agents, edetecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.
                                                                                                                                                                                                                                                                                                                       autoimmune disease;

They can be used for treating IL-13 mediated conditions such as cartain allergic conditions such as astima or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool. Recombinant IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat IgE-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lupus, nephiritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in haematopoietic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expression at least one chain of the IL-13 receptor other than IL-13bc. IL-13bc can also be used in diagnosis to detect expression of IL-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.

The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (IL-5) receptor, which is synthesised from murine early P cell mRNA; an isolated murine (secretory) IL-5 receptor: an isolated cDNA sequence encoding human (secretory) IL-5 receptor; which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human; (secretory) IL-5 receptor. Also claimed are u COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human IL-5 lacking a cytoplasmic and a transmembrane region; and an expression vector.

Claim 7; Page 44; 69pp; English.

The IL-13 binding protein and related therapeutic molecules can be used in the antagenism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 such as asthma or to inactivate locally administered IL-13 after IL-13
                                                                                                                                                                                                                                                           11-5EP-1991; 308309.

The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (II-5) receptor, which is synthesised from murine early B cell mRNA; an isolated murine (secretory) II-5 receptor; an isolated cDNA sequence encoding human (secretory) II-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) II-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human II-5 lacking a cytoplasmic and a content of the DNA; secretory human II-5 lacking a cytoplasmic and a content of the DNA; secretory human II-5 lacking a cytoplasmic and a content of the DNA; secretory human II-5 lacking a cytoplasmic and a content of the DNA; secretory human II-5 lacking a cytoplasmic and a content of the DNA; secretory human II-5 lacking a cytoplasmic and cytoplasmic and cytoplasmic and cytoplasmic and cytoplasmic and cytoplasmic and

The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (IL-5) receptor, which is synthesised from murine early B cell mRNA; an isolated murine (secretory) IL-5 receptor; an isolated cDNA sequence encoding human (secretory) IL-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) IL-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human IL-5 lacking a cytoplasmic and a transmembrane region; and an expression vector.
                                                                                                                                                                                                                                                                                                                                                                                         Human and murine interleukin-5 for treatment of auto-immune ar

Sequence:

US-09-077-817-2
2104
1 MAFYCLAIGCLYTFLISTTF.....LLLRKPNTYPKMIPEFFCDT 380

Scoring table: BLOSUM62

Searched: 142080 segs, 47169319 residues

Database : PIR\_62:\*

Word size : 0

Number of hits that pass the threshold :

1: pir1:\*
2: pir2:\*
3: pir3:\*
4: pir4:\* 142080

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

11. FUNCTION: BINDS IL-13 WITH A LOW AFFINITY. TOGETHER WITH IL-4R-ALPHA CAN FORM A FUNCTIONAL RECEPTOR FOR IL-13. ALSO SERVES AS:
ALPERNATE ACCESSORY PROTEIN TO THE COMMON CYTOKINE RECEPTOR GAM
ALTERNATE ACCESSORY PROTEIN TO THE COMMON CYTOKINE RECEPTOR GAM
CHAIN FOR IL-4 SIGNALING, BUT CANNOT REPLACE THE FUNCTION OF
GAMMA-C IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY.

11. SUBUNIT: INTERLEUKIN.13 RECEPTOR IS A COMPLEX OF IL4R-ALPHA,
                                                                                                                                                                                                                                                                                             CONFLICT

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SEBCIFICITY: UBJOULTOUS, HIGHEST LEVELS IN HEART, LIVER,
SKELETAL MUSCLE AND OVARY; LOWEST LEVELS IN BRAIN, LUNG AND
KIDNEY. ALSO FOUND IN B-CELLS, T-CELLS AND ENDOTHELIAL CELLS.
SIMILARITY: CONTAINS 1 IMMUNOCLOBULIN-LIKE C2-TYPE DOMAIN.
SIMILARITY: CONTAINS 1 FIBRONECTIN TYPE III-LIKE DOMAIN.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
